FACULTY OF ENGINEERING
PES UNIVERSITY**

(Established under Karnataka Act No. 16 of 2013)
100ft Ring Road, Bengaluru – 560 085, Karnataka, India

Problem Statement:

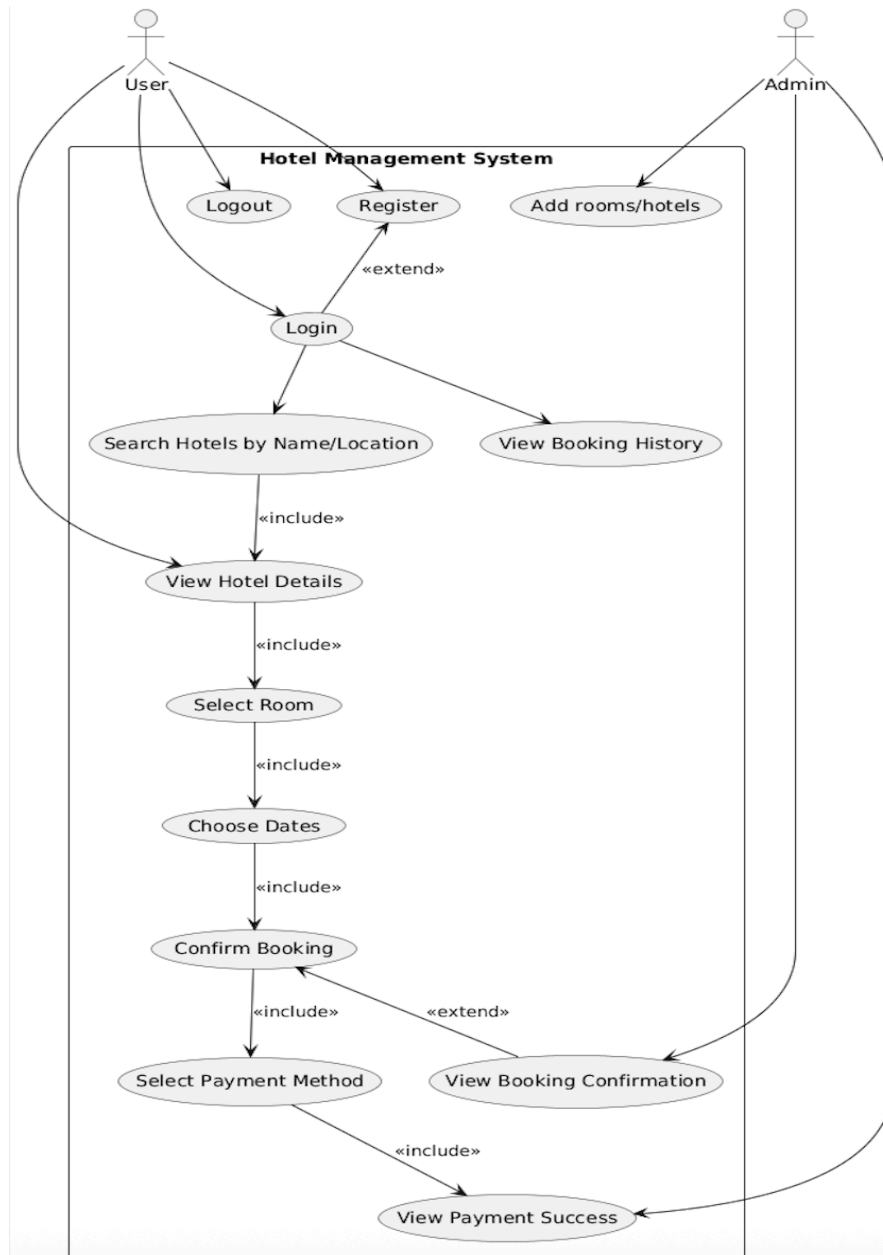

To design and develop a Hotel Management System that allows users to search for hotels and rooms, make bookings based on availability, confirm those bookings, simulate payments using different strategies, and view booking history. The system is structured using the MVC architecture and leverages Object-Oriented Design Principles and Design Patterns to ensure modularity, scalability, and maintainability.

Key Features:

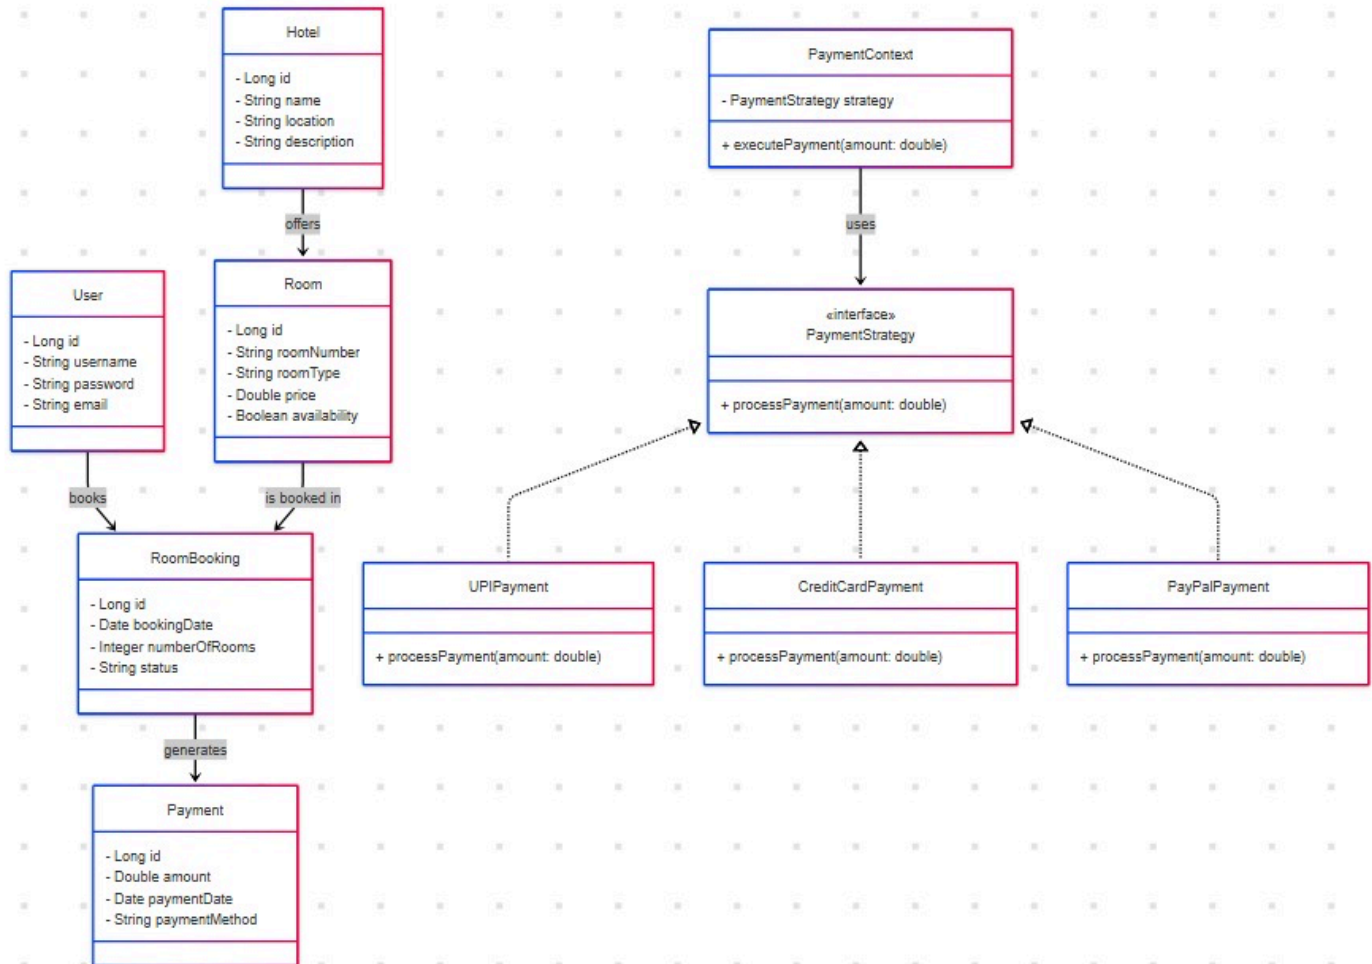

- Secure user registration and login (Spring Security)
- Hotel and room search functionality
- Room booking with selection of date
- Payment simulation via UPI, Credit Card, etc.
- Display booking confirmation and history
- Input validation using Thymeleaf

Models:

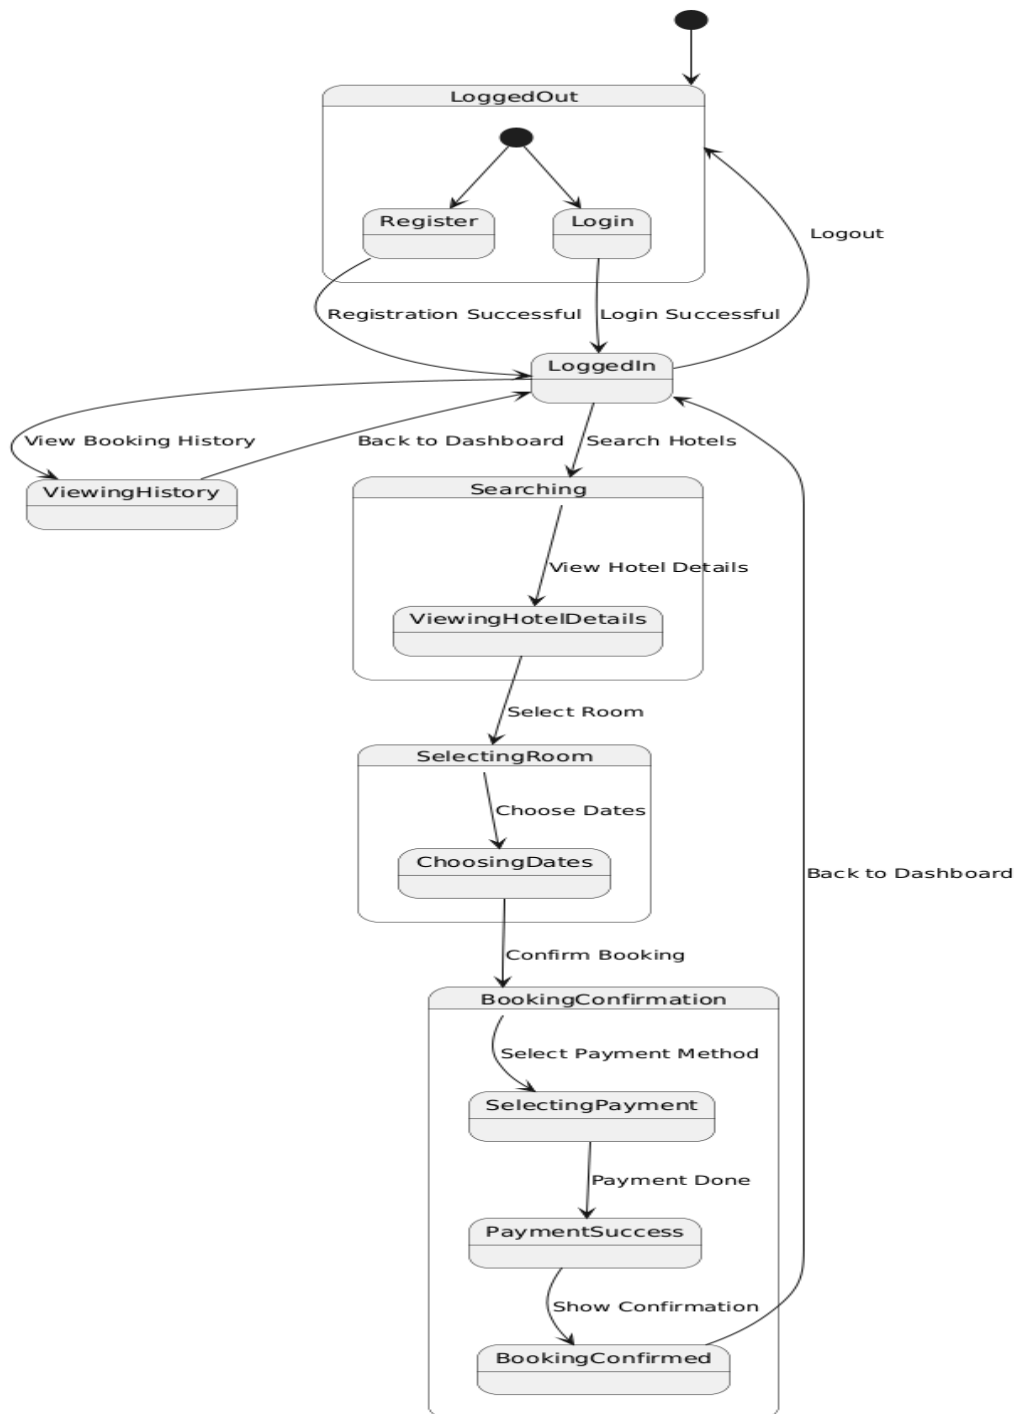

Use Case Diagram:

Class Diagram:

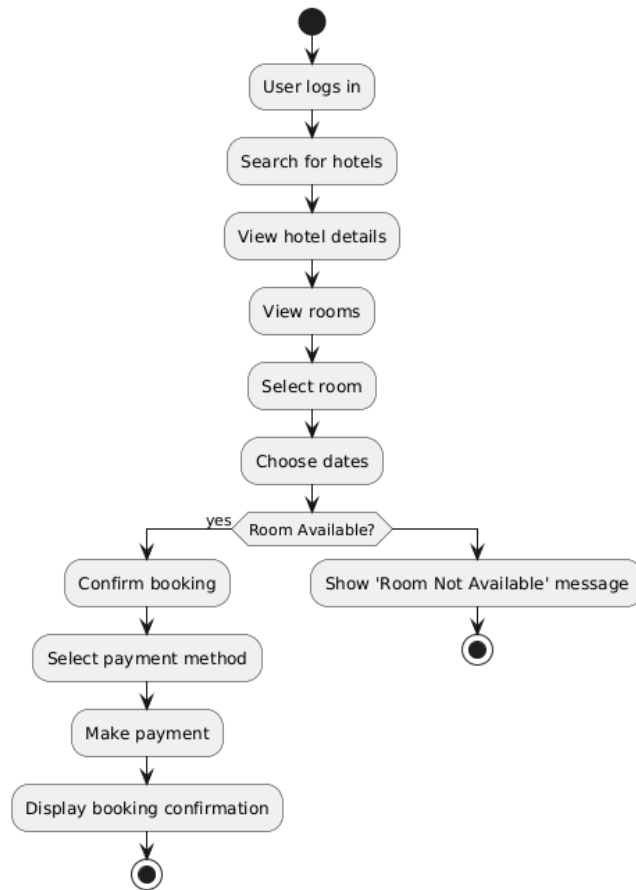

State Diagram:

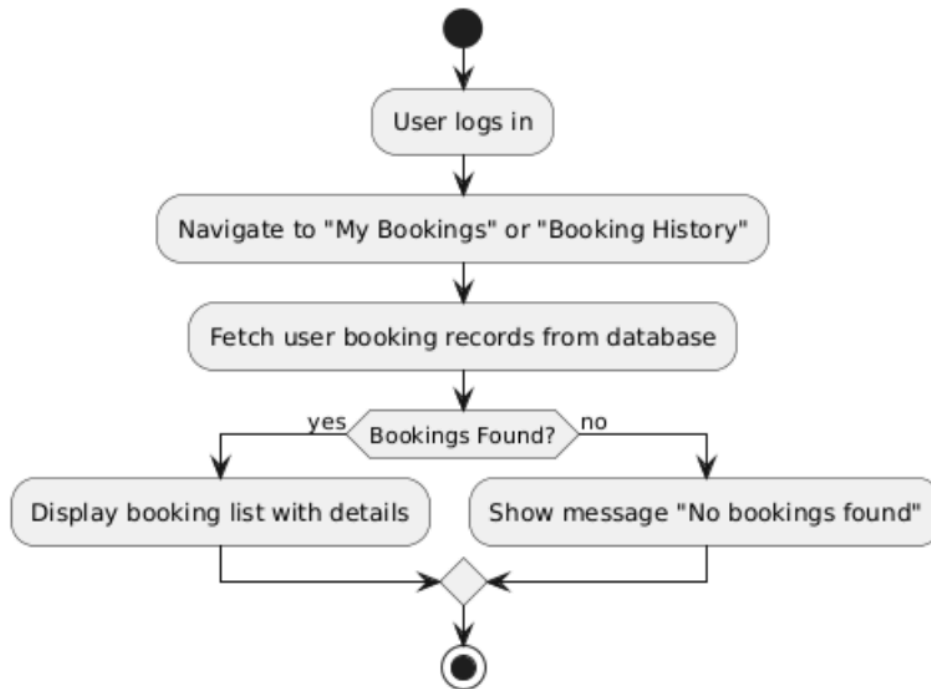

Activity Diagrams:

1. Major Use case : Room booking

2. Minor Use case: View booking history

Architecture Patterns

Model – View – Controller Pattern (MVC)

Design Principles

- 1) Single Responsibility Principle (SRP)
- 2) Open/Closed Principle (OCP)
- 3) Liskov Substitution Principle (LSP)
- 4) Dependency Inversion Principle (DIP)

Design Patterns

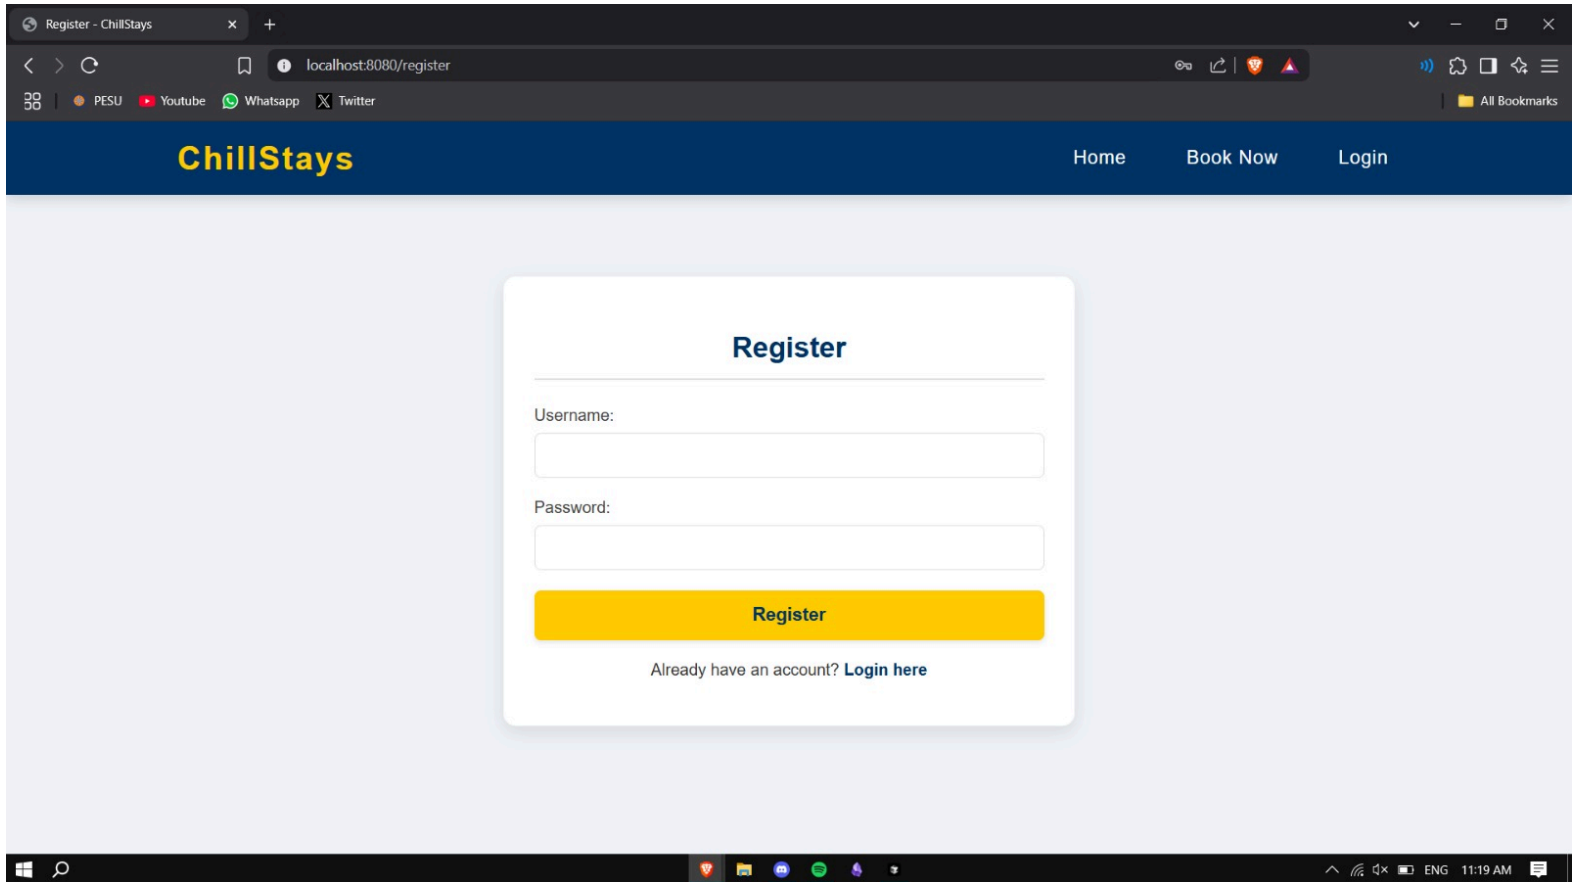

- 1) **Factory Design** : In the BookingFactory or RoomBookingFactory, to instantiate different types of bookings depending on user input.
- 2) **Builder Pattern** : To construct a RoomBooking object step by step.
- 3) **Strategy Pattern** : Used to implement various Payment methods.
- 4) **Repository Pattern** : used to abstract the data access layer. It acts as a bridge between the domain (business logic) and data mapping layers.
